# The legacy of Ramanujan's mock theta functions: Harmonic Maass forms in number theory 

Ken Ono<br>Emory University

Srinivasa Ramanujan (1887-1920)

## "Death bed letter"

Dear Hardy,
"I am extremely sorry for not writing you a single letter up to now... . I discovered very interesting functions recently which I call "Mock" $\vartheta$-functions. . . . they enter into mathematics as beautifully as the ordinary theta functions. I am sending you with this letter some examples."

Ramanujan, January 12, 1920.

## Some examples

$$
\begin{aligned}
& f(q):=1+\sum_{n=1}^{\infty} \frac{q^{n^{2}}}{(1+q)^{2}\left(1+q^{2}\right)^{2} \cdots\left(1+q^{n}\right)^{2}} \\
& \omega(q):=\sum_{n=0}^{\infty} \frac{q^{2 n^{2}+2 n}}{(1-q)^{2}\left(1-q^{3}\right)^{2} \cdots\left(1-q^{2 n+1}\right)^{2}}, \\
& \lambda(q):=\sum_{n=0}^{\infty} \frac{(-1)^{n}(1-q)\left(1-q^{3}\right) \cdots\left(1-q^{2 n-1}\right) q^{n}}{(1+q)\left(1+q^{2}\right) \cdots\left(1+q^{n-1}\right)} .
\end{aligned}
$$

## Aftermath of the letter

Although Ramanujan's secrets died with him, we have:

## Aftermath of the letter

Although Ramanujan's secrets died with him, we have:

- Works by Atkin, Andrews, Dyson, Selberg, Swinnerton-Dyer, and Watson on these 22 series.

## Aftermath of the letter

Although Ramanujan's secrets died with him, we have:

- Works by Atkin, Andrews, Dyson, Selberg, Swinnerton-Dyer, and Watson on these 22 series.
- Bolster the view that Ramanujan had found something.

## G. N. Watson's 1936 Presidential Address

## G. N. Watson's 1936 Presidential Address

"Ramanujan's discovery of the mock theta functions makes it obvious that his skill and ingenuity did not desert him at the oncoming of his untimely end.

As much as any of his earlier work.... the mock theta functions are an achievement sufficient to cause his name to be held in lasting remembrance.

## G. N. Watson's 1936 Presidential Address

## Comments

## Comments

- Since I, II, and III are very broad topics, I shall choose partitions to illustrate our results.

## Comments

- Since I, II, and III are very broad topics, I shall choose partitions to illustrate our results.
- Along the way, I will explain some of the essential features (e.g. definitions) of the theory.

## Adding and counting

## Definition

A partition is any nonincreasing sequence of integers summing to $n$.

$$
p(n):=\#\{\text { partitions of } n\} .
$$

## Adding and counting

## Definition

A partition is any nonincreasing sequence of integers summing to $n$.

$$
p(n):=\#\{\text { partitions of } n\} .
$$

## Example

The partitions of 4 are:

$$
4, \quad 3+1, \quad 2+2, \quad 2+1+1, \quad 1+1+1+1,
$$

and so $p(4)=5$.

## Ramanujan's Congruences

## Theorem (Ramanujan)

For every $n$, we have

$$
\begin{aligned}
p(5 n+4) & \equiv 0 \quad(\bmod 5) \\
p(7 n+5) & \equiv 0 \quad(\bmod 7) \\
p(11 n+6) & \equiv 0 \quad(\bmod 11)
\end{aligned}
$$

## Ramanujan's Congruences

## Theorem (Ramanujan)

For every $n$, we have

$$
\begin{aligned}
p(5 n+4) & \equiv 0 \quad(\bmod 5) \\
p(7 n+5) & \equiv 0 \quad(\bmod 7) \\
p(11 n+6) & \equiv 0 \quad(\bmod 11)
\end{aligned}
$$

## Remark

Attempting to explain them, Dyson defined the "rank."

## Dyson's Rank

## Definition

The rank of a partition is its largest part minus its number of parts.

$$
N(m, n):=\#\{\text { partitions of } n \text { with rank } m\} .
$$

## Dyson's Rank

## Definition

The rank of a partition is its largest part minus its number of parts.

$$
N(m, n):=\#\{\text { partitions of } n \text { with rank } m\} .
$$

## Example

The ranks of the partitions of 4 :

| Partition | Largest Part | \# Parts | Rank |
| :---: | :---: | :---: | :---: |
| 4 | 4 | 1 | $3 \equiv 3(\bmod 5)$ |
| $3+1$ | 3 | 2 | $1 \equiv 1 \quad(\bmod 5)$ |
| $2+2$ | 2 | 2 | $0 \equiv 0 \quad(\bmod 5)$ |
| $2+1+1$ | 2 | 3 | $-1 \equiv 4 \quad(\bmod 5)$ |
| $1+1+1+1$ | 1 | 4 | $-3 \equiv 2(\bmod 5)$ |

The legacy of Ramanujan's mock theta functions: Harmonic Maass forms in number theory Integer Partitions

## Dyson's Conjecture

## Definition

If $0 \leq r, t$, then let
$N(r, t ; n):=\#\{$ partitions of $n$ with rank $\equiv r \bmod t\}$.

## Dyson's Conjecture

## Definition

If $0 \leq r, t$, then let

$$
N(r, t ; n):=\#\{\text { partitions of } n \text { with rank } \equiv r \bmod t\} .
$$

Conjecture (Dyson, 1944)
For every $n$ and every $r$, we have

$$
\begin{aligned}
& N(r, 5 ; 5 n+4)=p(5 n+4) / 5 \\
& N(r, 7 ; 7 n+5)=p(7 n+5) / 7
\end{aligned}
$$

The legacy of Ramanujan's mock theta functions: Harmonic Maass forms in number theory Integer Partitions

## A famous theorem

Theorem (Atkin and Swinnerton-Dyer, 1954)
Dyson's Conjecture is true.

## A famous theorem

Theorem (Atkin and Swinnerton-Dyer, 1954)
Dyson's Conjecture is true.

## Remark

The proof depends on the generating function:

$$
R(w ; q)=\sum_{m, n} N(m, n) w^{m} q^{n}:=1+\sum_{n=1}^{\infty} \frac{q^{n^{2}}}{(w q ; q)_{n}\left(w^{-1} q ; q\right)_{n}},
$$

where

$$
(a ; q)_{n}:=(1-a)(1-a q) \cdots\left(1-a q^{n-1}\right) .
$$

## Revealing specializations

## Example

- For $w=1$ and $q:=e^{2 \pi i z}$, we have the modular form

$$
q^{-1} R\left(1 ; q^{24}\right)=\sum_{n=0}^{\infty} p(n) q^{24 n-1}
$$

## Revealing specializations

## Example

- For $w=1$ and $q:=e^{2 \pi i z}$, we have the modular form

$$
q^{-1} R\left(1 ; q^{24}\right)=\sum_{n=0}^{\infty} p(n) q^{24 n-1}
$$

- For $w=-1$, we have Ramanujan's mock theta

$$
R(-1 ; q)=1+\sum_{n=1}^{\infty} \frac{q^{n^{2}}}{(1+q)^{2}\left(1+q^{2}\right)^{2} \cdots\left(1+q^{n}\right)^{2}}
$$

## Modular Forms

## "Definition"

A modular form is any meromorphic function $f(z)$ on $\mathbb{H}$ for which

$$
f\left(\frac{a z+b}{c z+d}\right)=(c z+d)^{k} f(z)
$$

for all $\left(\begin{array}{ll}a & b \\ c & d\end{array}\right) \in \Gamma \subset \mathrm{SL}_{2}(\mathbb{Z})$.

## Natural Hope

## Question

Since the deepest facts about $p(n)$ come from modular form theory, is $R(w ; q)$, for roots of unity $w \neq 1$, modular?

## Natural Hope

## Question

Since the deepest facts about $p(n)$ come from modular form theory, is $R(w ; q)$, for roots of unity $w \neq 1$, modular?

## "Theorem" (Bringmann-O)

If $w \neq 1$ is a root of unity, then $R(w ; q)$ is the holomorphic part of a harmonic Maass form.

## Defining Maass forms

Notation. Throughout, let $z=x+i y \in \mathbb{H}$ with $x, y \in \mathbb{R}$.

## Defining Maass forms

Notation. Throughout, let $z=x+i y \in \mathbb{H}$ with $x, y \in \mathbb{R}$. Hyperbolic Laplacian.

$$
\Delta_{k}:=-y^{2}\left(\frac{\partial^{2}}{\partial x^{2}}+\frac{\partial^{2}}{\partial y^{2}}\right)+i k y\left(\frac{\partial}{\partial x}+i \frac{\partial}{\partial y}\right) .
$$

## Harmonic Maass forms

"Definition"
A harmonic Maass form is any smooth function $f$ on $\mathbb{H}$ satisfying:

## Harmonic Maass forms

## "Definition"

A harmonic Maass form is any smooth function $f$ on $\mathbb{H}$ satisfying:
(1) For all $A=\left(\begin{array}{ll}a & b \\ c & d\end{array}\right) \in \Gamma \subset \mathrm{SL}_{2}(\mathbb{Z})$ we have

$$
f\left(\frac{a z+b}{c z+d}\right)=(c z+d)^{k} f(z)
$$

## Harmonic Maass forms

## "Definition"

A harmonic Maass form is any smooth function $f$ on $\mathbb{H}$ satisfying:
(1) For all $A=\left(\begin{array}{ll}a & b \\ c & d\end{array}\right) \in \Gamma \subset \mathrm{SL}_{2}(\mathbb{Z})$ we have

$$
f\left(\frac{a z+b}{c z+d}\right)=(c z+d)^{k} f(z)
$$

(2) We have that $\Delta_{k} f=0$.

## A bit more precisely

## Definition

If $0<a<c$ are integers, then let

$$
S\left(\frac{a}{c} ; z\right):=B(a, c) \int_{-\bar{z}}^{i \infty} \frac{\Theta\left(\frac{a}{c} ; \ell_{c} \tau\right)}{\sqrt{-i(\tau+z)}} d \tau
$$

## A bit more precisely

## Definition

If $0<a<c$ are integers, then let

$$
S\left(\frac{a}{c} ; z\right):=B(a, c) \int_{-\bar{z}}^{i \infty} \frac{\Theta\left(\frac{a}{c} ; \ell_{c} \tau\right)}{\sqrt{-i(\tau+z)}} d \tau
$$

and define $D\left(\frac{a}{c} ; z\right)$ by

$$
\begin{aligned}
& D\left(\frac{a}{c} ; z\right):=-S\left(\frac{a}{c} ; z\right)+q^{-\frac{\ell_{c}}{24}} R\left(\zeta_{c}^{a} ; q^{\ell_{c}}\right) \\
& \Uparrow \Uparrow \\
& \Theta-\text { integral Dyson's series }
\end{aligned}
$$

## The first theorem

Theorem (Bringmann-O)
If $0<a<c$, then $D\left(\frac{a}{c} ; z\right)$ is a weight $1 / 2$ harmonic Maass form.

## The first theorem

Theorem (Bringmann-O)
If $0<a<c$, then $D\left(\frac{a}{c} ; z\right)$ is a weight $1 / 2$ harmonic Maass form.

## Remark

By exhibiting Maass forms, this is already interesting.

## Partition congruences revisited

Theorem ( 0,2000 )
For primes $\mathcal{Q} \geq 5$, there are infinitely many non-nested progressions $A n+B$ for which

$$
p(A n+B) \equiv 0 \quad(\bmod \mathcal{Q}) .
$$

## Partition congruences revisited

## Theorem (O, 2000)

For primes $\mathcal{Q} \geq 5$, there are infinitely many non-nested progressions $A n+B$ for which

$$
p(A n+B) \equiv 0 \quad(\bmod \mathcal{Q})
$$

Examples. Simplest ones for $17 \leq \mathcal{Q} \leq 31$ :

$$
\begin{aligned}
& p(48037937 n+1122838) \equiv 0 \quad(\bmod 17) \\
& p(1977147619 n+815655) \equiv 0 \quad(\bmod 19) \\
& p(14375 n+3474) \equiv 0 \quad(\bmod 23) \\
& p(348104768909 n+43819835) \equiv 0 \quad(\bmod 29), \\
& p(4063467631 n+30064597) \equiv 0 \quad(\bmod 31)
\end{aligned}
$$

## I. Maass form congruences

Theorem (Bringmann-O)
There are progressions $A n+B$ s.t. for all $0 \leq r<t$

$$
N(r, t ; A n+B) \equiv 0 \quad(\bmod \mathcal{Q})
$$

## I. Maass form congruences

Theorem (Bringmann-O)
There are progressions $A n+B$ s.t. for all $0 \leq r<t$

$$
N(r, t ; A n+B) \equiv 0 \quad(\bmod \mathcal{Q})
$$

## Remark

This is a Dyson-style proof of

$$
p(A n+B) \equiv 0 \quad(\bmod \mathcal{Q})
$$

The legacy of Ramanujan's mock theta functions: Harmonic Maass forms in number theory
Proofs of the two theorems
"Proof" of the second theorem

## "Proof" of the second theorem

- The Fourier expansions in $q:=e^{2 \pi i z}$ are special:

$$
D\left(\frac{a}{c} ; z\right)=q^{-\frac{\ell_{c}}{24}} R\left(\zeta_{c}^{a} ; q^{\ell_{c}}\right)+\sum_{n \in \mathbb{Z}} B(a, c, n) \gamma(c, y ; n) q^{-\widetilde{\ell}_{c} n^{2}}
$$

## "Proof" of the second theorem

- The Fourier expansions in $q:=e^{2 \pi i z}$ are special:

$$
D\left(\frac{a}{c} ; z\right)=q^{-\frac{\ell_{c}}{24}} R\left(\zeta_{c}^{a} ; q^{\ell_{c}}\right)+\sum_{n \in \mathbb{Z}} B(a, c, n) \gamma(c, y ; n) q^{-\tilde{\ell}_{c} n^{2}}
$$

- The "bad" coefficients are so sparse that the proof becomes Shimura correspondence $+\ell$-adic Galois repns $+\epsilon$.

## II. Exact formulas of Rademacher-type

## Problem (Rademacher)

Define $\alpha(n)$ by

$$
\begin{aligned}
f(q) & =R(-1 ; q) \\
& =\sum_{n=0}^{\infty} \alpha(n) q^{n}=1+q-2 q^{2}+\cdots+487 q^{47}+9473 q^{89}-\cdots
\end{aligned}
$$

## II. Exact formulas of Rademacher-type

## Problem (Rademacher)

Define $\alpha(n)$ by

$$
\begin{aligned}
f(q) & =R(-1 ; q) \\
& =\sum_{n=0}^{\infty} \alpha(n) q^{n}=1+q-2 q^{2}+\cdots+487 q^{47}+9473 q^{89}-\cdots
\end{aligned}
$$

Find an exact formula for

$$
\begin{array}{cc}
\alpha(n)= & N(0,2 ; n) \\
\Uparrow & N(1,2 ; n) \\
\text { even rank } & \text { odd rank, }
\end{array}
$$

## Rademacher-type exact formula

Conjecture (Andrews-Dragonette, 1966)
If $n$ is a positive integer, then

$$
\begin{aligned}
& \alpha(n)=\pi(24 n-1)^{-\frac{1}{4}} \\
& \times \sum_{k=1}^{\infty} \frac{(-1)^{\left.\frac{k+1}{2}\right\rfloor} A_{2 k}\left(n-\frac{k\left(1+(-1)^{k}\right)}{4}\right)}{k} \cdot I_{\frac{1}{2}}\left(\frac{\pi \sqrt{24 n-1}}{12 k}\right),
\end{aligned}
$$

where $A_{k}(n)$ is a "Kloosterman-type sum".

The legacy of Ramanujan's mock theta functions: Harmonic Maass forms in number theory
Exact formulas for Maass forms

## II. Exact formulas for Maass forms

Theorem (Bringmann-O, 2006)
The Andrews-Dragonette Conjecture is true.

## II. Exact formulas for Maass forms

Theorem (Bringmann-O, 2006)
The Andrews-Dragonette Conjecture is true.
Idea of the Proof.

## II. Exact formulas for Maass forms

## Theorem (Bringmann-O, 2006)

The Andrews-Dragonette Conjecture is true.

## Idea of the Proof.

- By the first theorem, the holomorphic part of the Maass form $D\left(\frac{1}{2} ; z\right)$ is $q^{-1} R\left(-1 ; q^{24}\right)$.

## II. Exact formulas for Maass forms

## Theorem (Bringmann-O, 2006)

The Andrews-Dragonette Conjecture is true.

## Idea of the Proof.

- By the first theorem, the holomorphic part of the Maass form $D\left(\frac{1}{2} ; z\right)$ is $q^{-1} R\left(-1 ; q^{24}\right)$.
- Construct the "right" Poincaré series

$$
P(z)=\frac{2}{\sqrt{\pi}} \sum_{M \in \Gamma_{\infty} \backslash \Gamma_{0}(2)} \chi(M)^{-1}(c z+d)^{-\frac{1}{2}} \phi(M z),
$$

where $\phi$ is a Whittaker function.

## Idea of the proof

- The "right" one has a Fourier expansion

$$
P(24 z)=\text { Nonholomorphic function }+\sum_{n=1}^{\infty} \beta(n) q^{24 n-1}
$$

where the $\beta(n)$ 's equal the expressions in the conjecture.

## Idea of the proof

- The "right" one has a Fourier expansion

$$
P(24 z)=\text { Nonholomorphic function }+\sum_{n=1}^{\infty} \beta(n) q^{24 n-1}
$$

where the $\beta(n)$ 's equal the expressions in the conjecture.

- Somehow prove that $D\left(\frac{1}{2} ; z\right)-P(24 z)$ is 0 .
$\square$

## II. Exact formulas for Maass forms

Theorem (Bringmann-O)
We have formulas for all harmonic Maass forms with weight $\leq 1 / 2$.

## II. Exact formulas for Maass forms

Theorem (Bringmann-O)
We have formulas for all harmonic Maass forms with weight $\leq 1 / 2$.

## Remark

Gives the theorem of Rademacher-Zuckerman for non-positive weight modular forms as a special case.

The legacy of Ramanujan's mock theta functions: Harmonic Maass forms in number theory
Fourier expansions and $\xi$

## Relation to classical modular forms

$$
S_{k}(\Gamma):=\text { weight } k \text { cusp forms on } \Gamma \text {, }
$$

$$
H_{2-k}(\Gamma):=\text { weight } 2-k
$$

$$
\text { harmonic Maass forms on } \Gamma \text {. }
$$

## Relation to classical modular forms

$$
\begin{aligned}
S_{k}(\Gamma):= & \text { weight } k \text { cusp forms on } \Gamma \\
H_{2-k}(\Gamma):= & \text { weight } 2-k \\
& \text { harmonic Maass forms on } \Gamma .
\end{aligned}
$$

## Lemma

If $w \in \frac{1}{2} \mathbb{Z}$ and $\xi_{w}:=2 i y^{w} \frac{\bar{\partial}}{\partial \bar{z}}$, then

$$
\xi_{2-k}: H_{2-k}(\Gamma) \longrightarrow S_{k}(\Gamma) .
$$

Moreover, this map is surjective.

## Harmonic Maass forms have two parts $\left(q:=e^{2 \pi i z}\right)$

Fundamental Lemma
If $f \in H_{2-k}$ and $\Gamma(a, x)$ is the incomplete $\Gamma$-function, then

$$
\begin{gathered}
f(z)=\sum_{n \gg-\infty} c_{f}^{+}(n) q^{n}+\sum_{n<0} c_{f}^{-}(n) \Gamma(k-1,4 \pi|n| y) q^{n} . \\
\downarrow
\end{gathered}
$$

## Relation with classical modular forms

## Fundamental Lemma

If $\xi_{w}:=2 i y^{w} \frac{\partial}{\partial \bar{z}}$, then

$$
\xi: H_{2-k} \longrightarrow S_{k}
$$

satisfies

$$
\xi(f)=\xi\left(f^{-}+f^{+}\right)=\xi\left(f^{-}\right) .
$$

## Relation with classical modular forms

Fundamental Lemma
If $\xi_{w}:=2 i y^{w} \frac{\bar{\partial}}{\partial \bar{z}}$, then

$$
\xi: H_{2-k} \longrightarrow S_{k}
$$

satisfies

$$
\xi(f)=\xi\left(f^{-}+f^{+}\right)=\xi\left(f^{-}\right) .
$$

## Question

What does the holomorphic part $f^{+}$unearth?

The legacy of Ramanujan's mock theta functions: Harmonic Maass forms in number theory
Fourier expansions and $\xi$

## Source of rich information

## Question

Can one use holomorphic parts of Maass forms to unearth hidden information related to $S_{k}(\Gamma)$ ?

## Source of rich information

## Question

Can one use holomorphic parts of Maass forms to unearth hidden information related to $S_{k}(\Gamma)$ ?

Answer. Yes, and we discuss two applications:

## Source of rich information

## Question

Can one use holomorphic parts of Maass forms to unearth hidden information related to $S_{k}(\Gamma)$ ?

Answer. Yes, and we discuss two applications:

- III. Exact formulas for Maass forms of Zagier-type.
- BSD numbers

## Rademacher's "exact formula"

Theorem (Rademacher (1943))
If $n$ is a positive integer, then
$p(n)=$ CRAZY convergent infinite sum.

## III. Exact formulas of Zagier-type

Theorem (Bruinier-O)
Let $F$ be the Maass form for which $\xi_{-2}(F)$ is in $S_{4}(6)$.

## III. Exact formulas of Zagier-type

## Theorem (Bruinier-O)

Let $F$ be the Maass form for which $\xi_{-2}(F)$ is in $S_{4}(6)$. Then

$$
\mathbb{P}(z):=-\left(\frac{1}{2 \pi i} \cdot \frac{d}{d z}+\frac{1}{2 \pi y}\right) F(z)
$$

has the property that

## III. Exact formulas of Zagier-type

## Theorem (Bruinier-O)

Let $F$ be the Maass form for which $\xi_{-2}(F)$ is in $S_{4}(6)$. Then

$$
\mathbb{P}(z):=-\left(\frac{1}{2 \pi i} \cdot \frac{d}{d z}+\frac{1}{2 \pi y}\right) F(z)
$$

has the property that its sum over disc $-24 n+1$ CM points is

$$
p(n)=\frac{1}{24 n-1} \cdot\left(\mathbb{P}\left(\alpha_{n, 1}\right)+\mathbb{P}\left(\alpha_{n, 2}\right)+\cdots+\mathbb{P}\left(\alpha_{n, h_{n}}\right)\right) .
$$

## III. Exact formulas of Zagier-type

## Theorem (Bruinier-O)

Let $F$ be the Maass form for which $\xi_{-2}(F)$ is in $S_{4}(6)$. Then

$$
\mathbb{P}(z):=-\left(\frac{1}{2 \pi i} \cdot \frac{d}{d z}+\frac{1}{2 \pi y}\right) F(z)
$$

has the property that its sum over disc $-24 n+1$ CM points is

$$
p(n)=\frac{1}{24 n-1} \cdot\left(\mathbb{P}\left(\alpha_{n, 1}\right)+\mathbb{P}\left(\alpha_{n, 2}\right)+\cdots+\mathbb{P}\left(\alpha_{n, h_{n}}\right)\right) .
$$

Moreover, each $(24 n-1) \mathbb{P}\left(\alpha_{n, m}\right)$ is an algebraic integer.

## Hard proof that $p(1)=1$.

If $\beta:=161529092+18648492 \sqrt{69}$, then

$$
\begin{aligned}
& \frac{1}{23} \cdot \mathbb{P}\left(\frac{-1+\sqrt{-23}}{12}\right)= \frac{1}{3}+\frac{\beta^{2 / 3}+127972}{6 \beta^{1 / 3}}, \\
& \frac{1}{23} \cdot \mathbb{P}\left(\frac{-13+\sqrt{-23}}{24}\right)= \frac{1}{3}-\frac{\beta^{2 / 3}+127972}{12 \beta^{1 / 3}}+\frac{\beta^{2 / 3}-127972}{4 \sqrt{-3} \beta^{1 / 3}} \\
& \frac{1}{23} \cdot \mathbb{P}\left(\frac{-25+\sqrt{-23}}{36}\right)=\frac{1}{3}-\frac{\beta^{2 / 3}+127972}{12 \beta^{1 / 3}}-\frac{\beta^{2 / 3}-127972}{4 \sqrt{-3} \beta^{1 / 3}}
\end{aligned}
$$

## Hard proof that $p(1)=1$.

If $\beta:=161529092+18648492 \sqrt{69}$, then

$$
\begin{aligned}
\frac{1}{23} \cdot \mathbb{P}\left(\frac{-1+\sqrt{-23}}{12}\right) & =\frac{1}{3}+\frac{\beta^{2 / 3}+127972}{6 \beta^{1 / 3}} \\
\frac{1}{23} \cdot \mathbb{P}\left(\frac{-13+\sqrt{-23}}{24}\right) & =\frac{1}{3}-\frac{\beta^{2 / 3}+127972}{12 \beta^{1 / 3}}+\frac{\beta^{2 / 3}-127972}{4 \sqrt{-3} \beta^{1 / 3}} \\
\frac{1}{23} \cdot \mathbb{P}\left(\frac{-25+\sqrt{-23}}{36}\right) & =\frac{1}{3}-\frac{\beta^{2 / 3}+127972}{12 \beta^{1 / 3}}-\frac{\beta^{2 / 3}-127972}{4 \sqrt{-3} \beta^{1 / 3}}
\end{aligned}
$$

and we see directly that

$$
p(1)=1=\frac{1}{23}\left(\mathbb{P}\left(\alpha_{1}\right)+\mathbb{P}\left(\alpha_{2}\right)+\mathbb{P}\left(\alpha_{3}\right)\right) .
$$

## First few minimal polynomials

$$
\begin{array}{cc}
n & x^{h_{n}}-(24 n-1) p(n) x^{h_{n}-1}+\ldots \\
\hline 1 & x^{3}-23 \cdot 1 x^{2}+\frac{3592}{23} x-419 \\

$$
E: y^{2}=x^{3}+A x+B
$$

## Theorem (Mordell-Weil)

The rational points of an elliptic curve over a number field form a finitely generated abelian group.

## The Congruent Number Problem

## Problem (Open)

Determine the integers which are areas of rational right triangles.

## The Congruent Number Problem

## Problem (Open)

Determine the integers which are areas of rational right triangles.

## Example

(1) The number 6 is congruent since it is the area of $(3,4,5)$.

## The Congruent Number Problem

## Problem (Open)

Determine the integers which are areas of rational right triangles.

## Example

(1) The number 6 is congruent since it is the area of $(3,4,5)$.
(2) The number 157 is congruent, since it is the area of

$$
\left(\frac{411340519227716149383203}{21666555693714761309610}, \frac{680 \cdots 540}{411 \cdots 203}, \frac{224 \cdots 041}{891 \cdots 830}\right) .
$$

## A Classical Diophantine Criterion

Theorem (Easy)
An integer $D$ is congruent if and only if the elliptic curve

$$
E_{D}: \quad D y^{2}=x^{3}-x
$$

has positive rank.

The legacy of Ramanujan's mock theta functions: Harmonic Maass forms in number theory
Algebraicity of Maass forms and L-functions

## Quadratic twists

## Definition

Let $E / \mathbb{Q}$ be the elliptic curve

$$
E: y^{2}=x^{3}+A x+B
$$

## Quadratic twists

## Definition

Let $E / \mathbb{Q}$ be the elliptic curve

$$
E: y^{2}=x^{3}+A x+B
$$

If $\Delta$ is a fund. disc., then the $\Delta$-quadratic twist of $E$ is

$$
E(\Delta): \quad \Delta y^{2}=x^{3}+A x+B
$$

## Birch and Swinnerton-Dyer Conjecture

## Conjecture

If $E / \mathbb{Q}$ is an elliptic curve and $L(E, s)$ is its L-function, then

$$
\operatorname{ord}_{s=1}(L(E, s))=\operatorname{rank} \text { of } E(\mathbb{Q}) .
$$

## Birch and Swinnerton-Dyer Conjecture

## Conjecture

If $E / \mathbb{Q}$ is an elliptic curve and $L(E, s)$ is its L-function, then

$$
\operatorname{ord}_{s=1}(L(E, s))=\operatorname{rank} \text { of } E(\mathbb{Q})
$$

A good question. How does one compute $\operatorname{ord}_{s=1}(L(E, s))$ ?

The legacy of Ramanujan's mock theta functions: Harmonic Maass forms in number theory
Algebraicity of Maass forms and $L$-functions

## Kolyvagin's Theorem

Theorem (Kolyvagin)
If $\operatorname{ord}_{s=1}(L(E, s)) \leq 1$, then

$$
\operatorname{ord}_{s=1}(L(E, s))=\operatorname{rank} \text { of } E .
$$

## Kolyvagin's Theorem

Theorem (Kolyvagin)
If $\operatorname{ord}_{s=1}(L(E, s)) \leq 1$, then

$$
\operatorname{ord}_{s=1}(L(E, s))=\operatorname{rank} \text { of } E
$$

## Question

How does one compute $L(E, 1)$ and $L^{\prime}(E, 1)$ ?

## Formulas for $L(E(\Delta), 1)$

## Theorem (Shimura-Kohnen/Zagier-Waldspurger)

There is a modular form

$$
g(z)=\sum_{n=1}^{\infty} b_{E}(n) q^{n}
$$

such that if $\Delta<0$ and $\left(\frac{\Delta}{p}\right)=1$, then

$$
L(E(\Delta), 1)=\alpha_{E}(\Delta) \cdot b_{E}(|\Delta|)^{2}
$$
