

# A Hybrid Control Model of Fractone-Dependent Morphogenesis

Aaron Tamura-Sato

University of Hawaii at Manoa

May 28, 2015

Many thanks go to:

- Dr. Monique Chyba
- Dr. Frederic Mercier
- Committee Members: Dr. George Wilkens, Dr. Daisuke Takagi, Dr. Yuriy Mileyko, Dr. Thomas Ernst
- Dr. Zou Rong and Mr. Zachary Dewese

This research received support from the NSF: NSF Award DGE-0841223.

# Table of contents

- 1 Biological Background Information
  - What is Morphogenesis?

# Morphogenesis

What is **Morphogenesis**?

# Morphogenesis

## What is Morphogenesis?

- The biological process that gives a developing organism its shape.

# Morphogenesis

## What is Morphogenesis?

- The biological process that gives a developing organism its shape.
- Important Factors: DNA and the Extracellular Matrix

# Extracellular Matrix

## What is the **Extracellular Matrix**?

- Collection of molecules outside of cells (including basal lamina)
- Gives Structure
- Affects Behavior (communication, migration, differentiation)
- Has Growth Factors

# Growth Factors

## What is a Growth Factor/Cytokine?

- Chemical signal for cell
- Several families and types
- Signal many behaviors: Migration, Differentiation, Apoptosis, Mitosis
- Created by various cells

# Growth Factors

## What is a **Growth Factor/Cytokine**?

- Chemical signal for cell
- Several families and types
- Signal many behaviors: Migration, Differentiation, Apoptosis, Mitosis
- Created by various cells

Examples from White Blood Cells and Cancer Cells

# Lateral Ventricle

# 4th Ventricle

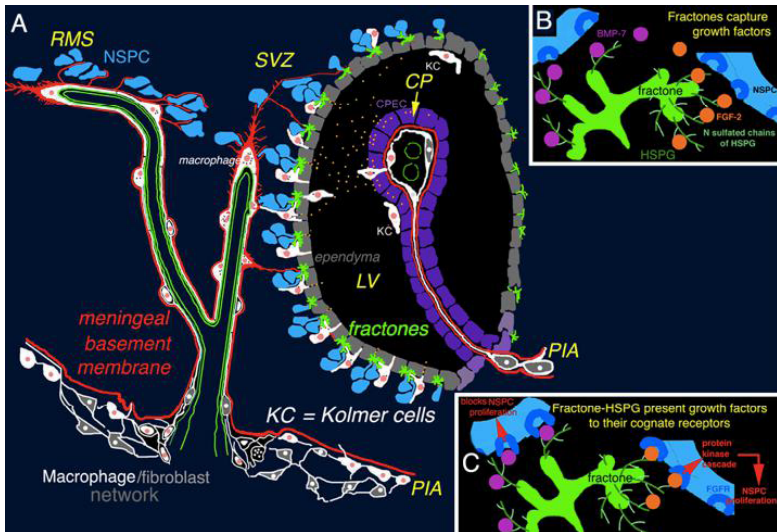

# Fractones

Basal lamina structures, termed **fractones**, directly contact neural stem cells, contact macrophage and fibroblast networks, and are associated with cell proliferation (creation)

# Hypothesized Function

# Hypothesized Function

# Embryonic Fractones

# Biology

But testing the fractone hypothesis is hard...

# Alan Turing

1912-1954

# Reaction-Diffusion Model

The Chemical Basis of Morphogenesis, 1952

$$\left. \begin{aligned} \frac{dX_r}{dt} &= f(X_r, Y_r) + \mu(X_{r+1} - 2X_r + X_{r-1}) \\ \frac{dY_r}{dt} &= g(X_r, Y_r) + \nu(Y_{r+1} - 2Y_r + Y_{r-1}) \end{aligned} \right\} (r = 1, \dots, N)$$

with  $X_1 = X_{N+1}$  and  $Y_1 = Y_{N+1}$

# Reaction-Diffusion Model

Let  $f(X_r, Y_r) = aX_r + bY_r$  and  $g(X_r, Y_r) = cX_r + dY_r$

$$\left. \begin{aligned} \frac{dX_r}{dt} &= aX_r + bY_r + \mu(X_{r+1} - 2X_r + X_{r-1}) \\ \frac{dY_r}{dt} &= cX_r + dY_r + \nu(Y_{r+1} - 2Y_r + Y_{r-1}) \end{aligned} \right\} (r = 1, \dots, N)$$

# Reaction-Diffusion Model

Recall heat equation:  $\frac{\partial u}{\partial t} = \mu \frac{\partial^2 u}{\partial x^2}$

$$\left. \begin{aligned} \frac{\partial X}{\partial t} &= a(X - h) + b(Y - k) + \frac{\mu'}{\rho^2} \frac{\partial^2 X}{\partial \theta^2} \\ \frac{\partial Y}{\partial t} &= c(X - h) + d(Y - k) + \frac{\nu'}{\rho^2} \frac{\partial^2 Y}{\partial \theta^2} \end{aligned} \right\}$$

# Cells

## Definition

We define a *cell body* as an ellipsoid of fixed volume  $V$  and semi-axis lengths  $r_1, r_2, r_3$ , with  $s \leq r_i \leq S, i \in \{1, 2, 3\}$ , for constants  $V, s, S \in \mathbb{R}$ .

$$V = \frac{4}{3}\pi(4.5)^3,$$

$$s = 3, S = 6$$

## Definition

We define a *cell time*,  $t_c \in \mathbb{R}$ , and pair it with a cell body,  $c_b$ , to define a *cell*,  $c = \{c_b, t_c\}$ .

## Cells

## Definition

Given  $\epsilon \in \mathbb{R}$  and a set of cell bodies,  $C = \{c_i\}$ , for each cell body with semi-axis lengths  $r_{1i}, r_{2i}, r_{3i}$  we assign a concentric ellipsoid,  $\hat{c}_i$ , with semi-axis lengths  $r_{1i} + \epsilon, r_{2i} + \epsilon,$  and  $r_{3i} + \epsilon$  respectively. Let  $\hat{C} = \bigcup_i \hat{c}_i$ . If  $\hat{C}$  is a compact connected space and  $c_i \cap c_j = \emptyset, \forall i, j, i \neq j$ , then the configuration is *admissible*.

# Fractones and Meninges and Growth Factors

## Definition

We define the *meningeal cell* centered at  $(x_0, y_0, z_0) \in A$  as

$$\overline{B_{\epsilon/2}(x_0, y_0, z_0)} = \left\{ (x, y, z) \in A \mid (x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 \leq \left(\frac{\epsilon}{2}\right)^2 \right\}$$

The center of meningeal cells are placed on the boundary of  $\hat{C}$ .

# Fractones and Meninges and Growth Factors

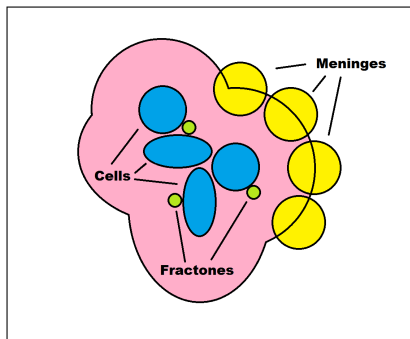

## Definition

We define the *fractone* centered at  $(x_0, y_0, z_0) \in A$  as

$\overline{B_r(x_0, y_0, z_0)}$  where  $r = \frac{1}{9} \sqrt[3]{\frac{3}{4\pi} V} = 0.5$ . Given an admissible set of cells,  $C$ , a set of fractones,  $\{f_q\}$ , is *admissible* if every fractone is tangent to at least one cell body and  $f_i \cap f_j = \emptyset, \forall i, j, i \neq j$ .

# Fractones and Meninges and Growth Factors

(a)

(b)

Two types of Growth Factors, Fractones, and Growth

# Biological Structure

## Definition

Given an admissible set of cells,  $C$ , and admissible meninges,  $C_m$ , we define the pair as a *cell mass*,  $M = \{C, C_m\}$ .

## Definition

We define a *biological structure* as a triple,  $\{M, F^+, F^-\}$ , as a cell mass,  $M$ , paired with two admissible sets of fractones,  $F^+$  and  $F^-$ , which represent the positive and negative fractones, respectively, in the system.

# Hybrid Models

## Hybrid Models

- Model continuous and discrete dynamics together
- Several model types exist
- Increasingly popular
- Limited number of results currently exist

# Hybrid Automata Systems

$$H = (Q, X, f, Init, D, E, G, R)$$

# Discrete State

$Q$ : A finite set of discrete variables. By  $\mathbf{Q}$ , we denote the set of values these variables can take.

# Continuous State

$X$ : A finite set of continuous variables. We will always choose the continuous variables to be real-valued. We denote the set of valuations of  $n$  such variables  $\mathbf{X} = \mathbb{R}^n$ .

# Continuous Dynamics

$f : \mathbf{Q} \times \mathbf{X} \rightarrow T\mathbf{X}$ . The vector field describing the evolution of the continuous vector. Here  $T\mathbf{X}$  denotes the tangent bundle of  $\mathbf{X}$ . We will assume for all  $q \in \mathbf{Q}$  that  $f(q, \cdot)$  is globally Lipschitz continuous.

# Initial Conditions

$Init \subseteq \mathbf{Q} \times \mathbf{X}$ . A set of initial continuous and discrete states. By  $\mathbf{Q} \times \mathbf{X}$ , we denote the set of valuations on  $Q \times X$ .

# Domain

$D : \mathbf{Q} \rightarrow P(\mathbf{X})$ . Here  $P(\mathbf{X})$  denotes the set of all subsets of  $\mathbf{X}$ .  $D$  is a “domain”. For  $q \in \mathbf{Q}$ ,  $D(q)$  is the subset of  $\mathbf{X}$  in which the continuous evolution  $\dot{x} = f(q, x)$  occurs.

# Edges

$E \subseteq \mathbf{Q} \times \mathbf{Q}$  is the set of “edges”. The edge  $(q_i, q_j) \in \mathbf{Q} \times \mathbf{Q}$  represents the instantaneous change in discrete state from  $q_i$  to  $q_j$ .

Note: Not every pair of discrete states will be an edge.

# Guard Conditions

$G : E \rightarrow P(\mathbf{X})$ . The “guard conditions” for each edge - the subset of  $\mathbf{X}$  which will cause a switch in the discrete state, along the given edge.

# Reset Map

$R : E \times \mathbf{X} \rightarrow P(\mathbf{X})$ . The “reset map” for each edge. When a discrete switch occurs along edge  $E$ ,  $X$  may change, causing a discontinuous jump in the continuous dynamics.

# Hybrid Time Trajectory

A *hybrid time trajectory*,  $\tau$ , is a collection of intervals for continuous growth:  $\tau = \{I_i\}_{i=0}^N$  such that:

- $I_i = [\tau_i, \tau'_i]$  for all  $i < N$
- if  $N < \infty$ , then either  $I_N = [\tau_N, \tau'_N]$ , or  $I_N = [\tau_N, \tau'_N)$
- $\tau_i \leq \tau'_i = \tau_{i+1}$  for all  $i$ .

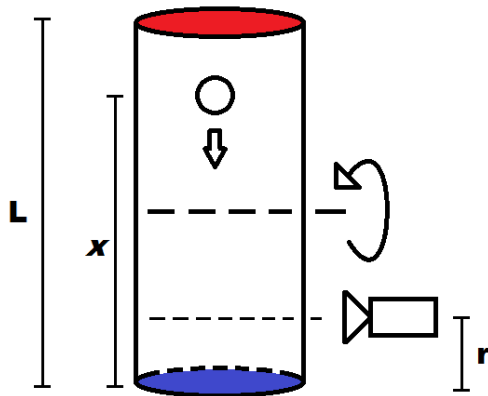

Define  $\langle \tau \rangle = \{0, 1, \dots, N\}$

# An Execution

An *execution* of a hybrid automaton,  $H$ , is a collection  $\chi = (\tau, \hat{q}, \hat{x})$ , where  $\tau$  is a hybrid time trajectory,  $\hat{q} : \langle \tau \rangle \rightarrow \mathbf{Q}$ , and  $\hat{x} = \{\hat{x}^i(t) : i \in \langle \tau \rangle\}$  is a collection of differentiable maps  $\hat{x}^i : I_i \rightarrow \mathbf{X}$ , such that

- $(\hat{q}(0), \hat{x}^0(0)) \in \text{Init}$
- $\forall t \in [\tau_i, \tau'_i), \dot{\hat{x}}^i(t) = f(q(i), \hat{x}^i(t))$  and  $\hat{x}^i(t) \in D(\hat{q}(i))$
- $\forall i \in \langle \tau \rangle \setminus \{N\}, e \equiv (\hat{q}(i), \hat{q}(i+1)) \in E$ , and  $\hat{x}^i(\tau'_i) \in G(e)$ , and  $\hat{x}^{i+1}(\tau_{i+1}) \in R(e, \hat{x}^i(\tau'_i))$

# Hybrid Automata Systems

# Discrete State

$Q$ : A finite set of discrete variables.

---

$$Q = \{q\}$$
$$\mathbf{Q} = \{\text{RED}, \text{BLUE}\}$$

# Continuous State

$X$ : A finite set of continuous variables.

---

Distance of the ball from the blue side.

$$X = \{x\}$$

$$\mathbf{X} = \mathbb{R}$$

# Continuous Dynamics

$$f : \mathbf{Q} \times \mathbf{X} \rightarrow T\mathbf{X}.$$

---

$$f(\text{RED}, x) = -\nu$$

$$f(\text{BLUE}, x) = \nu$$

# Initial Conditions

$$Init \subseteq \mathbf{Q} \times \mathbf{X}.$$

---

$$Init = \{(q, x) | q = \text{RED}, x \in (r, L]\}$$

# Domain

$$D : \mathbf{Q} \rightarrow P(\mathbf{X}).$$

---

$$D(\text{RED}) = \{x \in \mathbb{R} : x \geq r\}$$

$$D(\text{BLUE}) = \{x \in \mathbb{R} : x \leq L - r\}$$

# Edges

$$E \subseteq \mathbf{Q} \times \mathbf{Q}$$

---

$$E = \{(\text{RED}, \text{BLUE}), (\text{BLUE}, \text{RED})\}$$

# Guard Conditions

$$G : E \rightarrow P(\mathbf{X}).$$

---

$$G(\text{RED}, \text{BLUE}) = \{x \in \mathbb{R} : x = r\}$$

$$G(\text{BLUE}, \text{RED}) = \{x \in \mathbb{R} : x = L - r\}$$

# Reset Map

$$R : E \times \mathbf{X} \rightarrow P(\mathbf{X}).$$

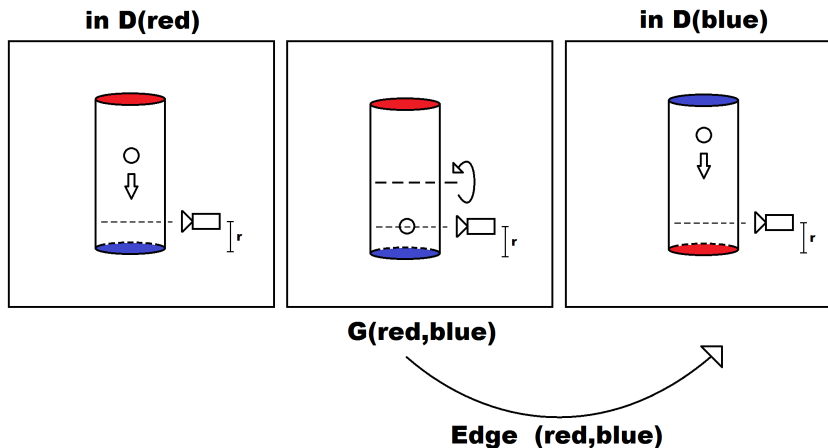

---

$$R((\text{RED}, \text{BLUE}), X) = X$$

$$R((\text{BLUE}, \text{RED}), X) = X$$

# Example

# Our Model

- $Q$  is the arrangement of cells, fractones, and meninges
- $X$  is the distribution of growth factors in the system
- Continuous dynamics ( $f$ ): Perturbed diffusion dependent on  $Q$  and  $X$
- Edges ( $E$ ): Define the rules of growth
- Growth conditions ( $G$ ): Growth governed by growth factor capture and time
- Growth factor pushing ( $R$ ): Growth causes physical pushing of growth factor

# Changes to Hybrid Automata

- 1 Explicit time dependence (Timed Automata)
- 2 Control
- 3 Function space  $X$

# Continuous and Discrete Spaces

$Q$ : A set of discrete variables

$X$ : A set of continuous variables (but in our case, density functions and time)

**Q**: The set of all biological structures

**X**: A function space of all density functions

$f, Init$ 

## Perturbed Diffusion

- The continuous dynamic  $f(q, X)$  describes the diffusion of the growth factors
- Cells and meninges block diffusion
- Fractones act as sinks

## Initial Conditions

$$Init \subseteq \mathbf{Q} \times \mathbf{X}$$

# Domains, Guards, and Edges

## Discrete Dynamics

- $D : \mathbf{Q} \rightarrow P(\mathbf{X})$  - Domain, the continuous states allowed in each discrete state
- $E \subseteq \mathbf{Q} \times \mathbf{Q}$  - Edges, the allowed discrete changes
- $G : E \rightarrow P(\mathbf{X})$  - Guard conditions, the continuous states that cause a discrete change

# Domains, Guards, and Edges

# Domains, Guards, and Edges

$$G(e_1) = \left\{ (X_1(x, t), X_2(x, t), T) \mid \int_{\gamma_1} (X_1(x, t) - X_2(x, t)) dx \geq 100, \right. \\ \left. T \geq 360 \right\}$$

# Reset Map: GF Pushing

## Reset Map

$$R : E \times \mathbf{X} \rightarrow P(\mathbf{X})$$

- Describes the change in the continuous state caused by a change in the discrete state.
- Can cause discontinuous jumps in the continuous state
- Represents the pushing of growth factors when cells move

# Control

## Control

- $u : A \times \mathbb{R} \rightarrow \{0, 1\}$
- Determines location of fractones
- $f$ ,  $G$ , and  $D$  are now dependent on  $u$
